Quality covers
Nors: This is a 'working draft' sequence. It currently
consists of 40 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

* NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as 'runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                   Sequencing vector: M13, 0%

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a Yac.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL: Sw., SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP database can be found at the continuous and regions are used to associate primary and the continuous manager. Accound at the continuous manager ac.uk/Projects/C elegans/wormpep RP24-173B15 is from a Male (CFSPL/64) mouse BAC Library VECTOR: pTARBACI.

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* consists of 1 contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* i 220394: contig of 220394 bp in length.
Sanders, W., Savery, G., Scherer, S., Scott, G., Shatsman, S., Shen, H., Shetty, J., Shvartsbeyn, A., Sisson, I., Sitter, C.D., Smajs, D., Sneed, A., Sodegren, E., Song, X.-Z., Sorelle, R., Sosa, J., Strong, R., Sutton, A., Tabor, P., Taylor, C., Taylor, T., Thomas, N., Thomas, A., Tingey, A., Trejos, Z., Usmani, K., Valas, R., Vera, V., Villasana, D., Waldron, L., Walker, B., Wang, J., Wang, G., Warren, B., Warren, R., Wei, X., White, F., Williams, G., Willson, R., Wleczyk, R., Wooden, H., Worley, K., Wright, D., Wright, R., Wu, J., Yakub, S., Yen, J., Yoon, L., Yoon, V., Yu, F., Zhang, J., Zhou, J., Zhou, J., Zhou, J., Zhou, J., Weinstock, G. and Gibbs, R.A.

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|q132114|gb|AP123072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melangqaster BAC library (Dros BAC) was made by Alain Billaud at CEFH (Centre project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     тккитстстнитттититититититеттсттотититититетти 637

```
The invention relates to breast specific nucleic acids (BSNA) and breast-specific polypeptides (BSP). Also included are a method for determining the BSNA in a sample, a vector comprising a BSNA, a host call comprising the vector, a method for producing a polypeptide encoded by a BSNA, an anti-BSP antibody and a method for determining the presence of a BSP in a sample. The breast-specific nucleic acids, polypeptides and compositions comprising them are useful for identifying, diagnosing, monitoring, staging, imaging, and treating breast cancer, mammary tumour and non-cancerous disease states in breast tissue, for identifying breast tissue, for monitoring, identifying and/or designing agonists and antagonists of the polypeptides; in gene therapy; in producing transgenic animals and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, ss, breast specific nucleic acid, BSNA, breast cancer, mammary tumour, cytostatic, gene therapy, non-cancerous breast disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New breast-specific nucleic acids and polypeptides, useful for identifying, diagnosing, monitoring, staging, imaging, and treating breast cancer and non-cancerous disease states in breast tissues.

            and as elements in an array or computer program for pattern recognition of breast disorders. The nucleic acids may be used as hybridisation probes to detect, characterise and quantify hybridising nucleic acids in, and isolate hybridising nucleic acids from, both genomic and transcript-derived nucleic acid samples. The BSP protein may be used in a vaccine composition for raising an immune response against breast cancer. The present sequence is BSNA cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; transgenic; drug metabolism; behaviour; PCR; primer; mouse; pharmacokinetic assay; pharmacodynamic assay; toxicology; serum albumin; alpha-acidic glycoprotein; CYP; multidrug resistance protein; MRP; uridine diphosphoglucuronosyl transferase; UGT; cytochrome P450.

This invention relates to a transgenic non-human animal which may be used for assessing the behaviour and/or metabolism of a drug in another animal and/or metabolism. The invention also comprises a nucleic acid construct of and which expresses a foreign polypeptide associated with drug behaviour and/or metabolism. The invention also comprises a nucleic acid construct for use in producing the metabolism and/or behavior of a drug in an animal and a method of interest, comprising administering a test agent to the transgenic animal and conducting analytical tests to determine drug metabolism and/or behaviour. The transgenic animal is useful in studying drug metabolism and/or behaviour in other animals. The nucleic acid construct is useful in producing, breeding and using transgenic animal and the methods are used for producing, breeding and using transgenic animals for pharmacological studies. Nucleic acid sequences used within the invention are serum attuding allowed and using gransgenic animal and the invention are serum cliphosphoglucuronosyl transferase (UGT); multidrug resistance proteins and (MRP's). The present sequence represents a PCR primer used to create
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                           14-AUG-2000; 214-AUG-2000; 214-AUG-2000; 2
   The invention relates to human polymucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to prytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polympoptides have various cytokine-like activities, e.g. stem cell growth factor activity, hemmatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                  Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        430 CAGAAGACAATTCAAATGTCCTTACACAGAAGACTGATTATAGATAATGGTACATTCA 489

                       The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention
                                                                                                                                                                                                                                                               387 TCCTTGAGGGTGAGTGAGAGTGATAGGGCTGAAGAACAGGAGAGACAAAGACAAAT

HUMAN GENOME SCI INC (HUMA-)

Barash SC, Ruben Rosen CA,

WPI; 2001-488786/53.

New isolated ovarian and/or breast cancer related nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders, particularly ovarian and/or breast cancer.

Disclosure; SEQ ID NO 1006; 577pp + Sequence Listing; English.

The invention relates to novel genes (ABA07454-ABA08224) and proteins (ABB1043-ABB10980) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, or ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, or breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, and and ulcerative colitis; (c) cantiovascular disorders e.g. erebral anoxia and epilepsy; and (f) cardiovascular disorders e.g. erebral anoxia and epilepsy; and (f) infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly XX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel polynucleotide encoding a guanosine triphosphare-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphare-binding protein coupled receptor. The protein sequences shown in ADC87618-ADC87623 represent polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        485

triphosphate-binding protein coupled receptor (GPCR). A polymucleotide of the invention may have a use in gene therapy. The polymucleotide and polymeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the quanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADCR7618-ADCR7623 represent polymucleotide sequences related to the invention.

The present invention describes a method (MI) for screening for an anti-
neoplastic agent. The method involves exposing cells to a chemical agent
to be tested for anti-neoplastic activity, determining a change in
expression of at least one gene (I) of a signature gene set, where (I)
comprises a sequence (S) selected from 847 sequences (given in ABL61664
to ABL70110), or is at least 95% identical to (S), where a change in
expression is indicative of anti-neoplastic activity. (I) has cytostatic
activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Carter KC, Ebner R, Endress G, Horrigan S;

the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                         409 ATAGGGCTGAAGAACAGGAGACAGAAGACAATTCAAATGTCCTTACACAGAAGACTGATT 468

The present invention describes a method (M1) for screening for an anti-
neoplastic agent. The method involves exposing cells to a chemical agent
to be tested for anti-neoplastic activity, determining a change in
comprises a sequence (S) selected from 8447 sequences (given in ABL61664
to ABL70110), or is at least 95% identical to (S), where a change in
expression is indicative of anti-neoplastic activity. (I) has cytostatic
activity and can be used in gene therapy. M1 can be used for screening an
anti-neoplastic agent, and can be used for producing a product which is
the data collected with respect to the anti-neoplastic agent as a result
of M1, and the data is sufficient to convey the chemical structure and/or
properties of the agent. M1 can be used in the treatment of cancer such
as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney,
prostate or pencreatic cancer, adenocarinoma, carrioma, class cell
cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous
cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     159637 ATTGTTCAAAATAACAAAAGATTGGAAAGAAGGCAAATATCCTTGAGTAGAAGACTGATG 159696
                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 167343 BP; 49550 A; 37098 C; 35753 G; 44929 T; 0 U; 13 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    409 ATAGGGCTGAAGAACAGGAGACAGAAGACAATTCAAATGTCCTTACACAGAAGACTGATT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to detecting (M1) granulocyte (GC) activation (CC (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated GC, where a differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs, (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject, exposure of subject, exposure of a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene (s) from Gs in the tissue of inflammation in a subject, exposure of a subject, exposure of a subject, exposure of a subject, or a pathogen or sterile inflammation in a tissue, an allergic response in a subject, exposure of a subject, to a pathogen or sterile inflammation in a tissue, an allergic response in a complete of a contacting GA, preferably in an inflammation in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a contacting darknitis, glomerill or detecting an inflammation in a tissue, an allergic response in a contactive or inflammation in a tissue, an allergic response in freetion, viral infection, viral infection, paralite inflammatory and disease, ulcerative colitis, permanental and exposure of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I)
anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polyvariclectides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
expression by rectifying mutations or deletions in aptient's genome
complement the patients own production of (I). Additionally, (I)
that affect the activity of (I) by expressing inactive proteins or to
cupplement the patients own production of (I). Additionally, (I)
coupling and a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
concers and cancer menune/haematopoietic-related diseases, especially
cancers and cancer mecastases of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid molecule (I) encoding a Can 1 polypeptide. The Can 1 nucleic acid molecule is used to diagnose or treat infertility or premature ovarian failure or Sertoli Cell only syndrome in a mammal. The present sequence is that of a mouse Can 1 encoding chromosome 11 BAC clone RP23-27018 of the invention. Note: The present sequence is not given in the printed specification but was obtained through the GenBank reference ACO83381S
                                                                                                                                                                                                                                                                                                                                                                                                         A nucleic acid molecule (I) encoding a Can 1 polypeptide used in treating infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vunerary; anticonvulsant; antibacterial; antifungal; antiparaaitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein; musculoskeletal system; ds.

(HUMA-) HUMAN GENOME SCI INC

```
The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or amaliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues and isclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, carthritis and ulcerative colitis, (c) cardiovascular disoraese, such as mycoardial ischaemias; (d) wound healing; (e) neurological diseases e.g. ceebral anoxia and epilepsy; and (f) infectious diseases such as viral, chis patent did not form part of the printed specification, but was contented another the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5908 GAGGAACAAAAGCTTAAAGACAATCAAAATGTCCTTTAATAGAGGACTGTCTAAATCAAT 5967

Isolated polypeptide for treating, preventing and/or prognosing disorders related to the musculoskeletal system including musculoskeletal

```
The invention relates to novel genes (AAL14669-AAL17666) and proteins

(ABB03087-ABB04109) associated with the musculoskeletal system useful for
preventing, treating or ameliarating medical conditions e.g. by protein
or preventing, treating or ameliarating medical conditions e.g. by protein
or gene therapy. The genes are isolated from a range of human tissues
disclosed in the specification. The nucleic acids, proteins, antibodies
and (ant)agonists are useful in the diagnosis, treatment and prevention
of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the
adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver,
clung, or urogenital, (b) immune discorders e.g. Addison's disease,
allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis,
allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis,
allergies, autoimmune haemolytic acardivascular disorders such as
mycardial ischaemias; (d) wound healing; (e) neurological diseases e.g.
cerebral anoxia and epilepsy; and (f) infectious diseases such as viral,
cerebral anoxia and parastic infections. Note: The sequence data for
this patent did not form part of the printed specification, but was
obtained in electronic format directly from WIPO at
the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 11027. RESULT 7

```
Sequence 273, Application US/09964824A

Patent No. US20020102531A1

GENERAL INFORMATION:
TITLE OF INVENTION: Cancer Gene Determination and Therapeutic Screening Using Signat:
TITLE OF INVENTION: Sets

TITLE OF INVENTION: Sets

TITLE OF INVENTION: Sets

FILE REFERENCE: 689290-73

CURRENT APPLICATION NUMBER: US/09/964,824A

CURRENT APPLICATION NUMBER: US/60/236,033

PRIOR FILING DATE: 2000-09-28

PRIOR FILING DATE: 2000-09-28

PRIOR FILING DATE: 2000-09-28

PRIOR FILING DATE: 2000-09-28

PRIOR FILING DATE: 2000-09-28

NUMBER OF SEQ ID NOS: 583

SOFFWARE: PATENTIN VERSION 3.0
                                                                                                                                                                                                                                                                                                   159637 ATTGTTCAAAATAACAAAAGATTGGAAAGAAGGCAAATATCCTTGAGTAGAAGACTGATG 159696
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               159637 ATTGTTCAAAATAACAAAGATTGGAAGGAAGGCAAATATCCTTGAGTAGAAGACTGATG 159696

Patent No. 5834248

PATENT INFORMATION:

APPLICANT: FALB, DEAN A.

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE
TITLE OF INVENTION: TREATMENT AND DIAGNOSIS OF CARDIOVASCULAR DISEASE
NUMBER OF SEQUENCES: 38

CORRESPONDENCE ADDRESS:
ADDRESSEE: PENNIE & EDMONDS
STREET: 1155 Avenue of the Americas
CITY: New York
STATE: New York
CITY: New York
STATE: New York
